Please read README in Github.

Integrates Mistral AI's Codestral to generate code that the AI can use. With my previous examples of node generator and editor. An AGI can generate its own code and it can run those code. That can be used for its prompts.

AGI requires self-improvement to be considered as one, like humans, they are capable of improving their cognitive functions even without external training or teaching. Powered by RAG, it should retrieve the code it generated back then and improve it by optimizing it for better run time, fixing bugs, and generally using code to solve problems that the user asked.

An extension for Spirit AGI from my past projects.
